

Conditional evidence — Personal Upload Scheduler

Google Cloud project 49718646075 (yoake-archives-uploader) · Use case: video uploading and account management · OAuth 2.0: yes

1. OAuth 2.0 scopes requested by the client

Declared in `_pipeline/youtube_uploader.py`. These are the only scopes the client ever requests. Access can be revoked by the operator at <https://myaccount.google.com/permissions>.

```
SCOPES = [  
    "https://www.googleapis.com/auth/youtube.upload",  
    "https://www.googleapis.com/auth/youtube",  
    "https://www.googleapis.com/auth/youtube.force-ssl",  
]
```

2. Upload interface — step 1 of 3: dry run (no API call)

The client is a command-line tool. Before any upload, `--dry-run` prints the exact request body without contacting the API, so the operator can review it.

3. Upload interface — step 2 of 3: actual upload

The client first verifies that the OAuth token belongs to the expected channel, then uploads the video file and sets the custom thumbnail.

```
$ python _pipeline/youtube_uploader.py 06_edit/EP_E08/EP_E08_upload_config.json --token token_channel_e.pickle

```

4. Upload interface — step 3 of 3: result read back from the API

The uploaded video, read back with `videos.list`. It is private and scheduled to publish at the requested time. All content is owned by the operator.
